

TA-D900

*AEP Model
UK Model*

ELECTRONIC CROSSOVER NETWORK

SPECIFICATIONS

GENERAL

Power Requirements: 110 V, 120 V, 220 V, or 240 V ac, 50/60 Hz
AEP model: 220 V factory preset
UK model: 240 V factory preset

Power Consumption: 15 watts

Dimensions: Approx. 480(w) x 80(h) x 400(d) mm
(18⁷/₈ (w) x 3¹/₈ (h) x 15⁷/₈ (d) inches)
Including projecting parts and controls

Weight: Approx. 8.5 kg (18 lbs 12 oz), net
Approx. 9.5 kg (20 lbs 15 oz), in shipping carton

System: Filter characteristics: 24 dB-per-octave
Bessel function high-pass and low-pass
Buffer amp: DC amp

Crossover Frequency: UNIT 0: 50 Hz, 80 Hz, 100 Hz
UNIT 1: 140 Hz, 225 Hz, 280 Hz
UNIT 2: 500 Hz, 800 Hz, 1 kHz
UNIT 3: 1.25 kHz, 2 kHz, 2.5 kHz
UNIT 4: 5 kHz, 8 kHz, 10 kHz

Bandpass Gain: 0 dB

Inputs: 1 volt rated/7 volts maximum, 50 k Ω

Outputs: 1 volt rated/7 volts maximum, 100 Ω

Harmonic Distortion: Less than 0.05 % at 1 volt output

Signal-to-noise-ratio: Better than 110 dB (1 volt rated input, short-circuited input, A weighting)

Frequency Response: DC-100 kHz $\begin{smallmatrix} +0 \\ -1 \end{smallmatrix}$ dB

SAFETY-RELATED COMPONENT WARNING!!

COMPONENTS IDENTIFIED BY SHADING AND MARK  ON THE SCHEMATIC DIAGRAMS, EXPLODED VIEWS AND IN THE PARTS LIST ARE CRITICAL TO SAFE OPERATION. REPLACE THESE COMPONENTS WITH SONY PARTS WHOSE PART NUMBERS APPEAR AS SHOWN IN THIS MANUAL OR IN SUPPLEMENTS PUBLISHED BY SONY.

SECTION 1

OUTLINE

1-1. CIRCUIT DESCRIPTION

The TA-D900 is an electronic crossover network designed for use in multi-amplifier stereo systems. The input audio signal is divided into a number of different frequency bands, each band being amplified independently and passed on to individual speakers. See Fig.3 for an outline of the circuit diagram.

Each set of crossover frequency filters have been incorporated into separate plug-in type units. Suitable crossover frequencies for a wide range of speakers available on the market may be set by plugging in an appropriate combination of the 4 different units.

The crossover frequency of each unit is determined by the capacitance of the filters, and the frequency selector switches S1-S4. For 2-way to 4-way multi-amplifier systems, the crossover frequencies are set by adjusting S1-S4, and by rearranging the filter units in accordance with the crossover frequencies of the speakers employed. Levels are also adjusted to match the efficiency of each speaker.

Note that the following description refers to a 4-way multi-amplifier system.

1. Pre-buffer Amplifier Stage (see Fig. 1)

Fig. 1

The purpose of the pre-buffer amplifier (Q101, 103–105, D104) is to eliminate the influence of the preamplifier and connecting cord upon the filters. With 100% negative feedback applied to the first-stage differential amplifier (Q101) by resistor R107 (100 Ω), the pre-buffer amplifier has high input

impedance and low output impedance. In addition, a current-mirror loaded 2-stage differential amplifier structure reduces distortion to a very low level. Furthermore, in order to make the low channel amplifier a pure DC amplifier employing no coupling capacitors, a dual FET differential amplifier which suppresses DC drift has been used in the first stage (Q101). Dual transistors have also been used in the second stage differential amplifier (Q103) and current mirror (Q105) to further suppress DC drift. By connecting the base of Q104 to ground, the collector voltage of the PNP transistor on the left hand side of Q103 is reduced to almost 0V, thereby equalizing the collector voltage of both PNP transistors in Q103. The dual transistor P_c (power input dc to collector) are therefore very much the same, resulting in the amount of drift in both sides being balanced. The impedance-converted signal is then passed from the pre-buffer amplifier to CH1-CH4 where it is divided into 4 different frequency bands.

2. LOW Channel Stage (CH-1)

The low-pass filters employed in this stage achieve a very sharp cut-off slope of 24 dB/oct (12 dB/oct at filter 1-1 and again at filter 1-2). (See Fig. 3-1).

Each low-pass filter buffer amplifier has a high input impedance and low output impedance current-mirror loaded 2-stage differential amplifier, similar to the pre-buffer amplifier (Q101, 103-105, D104). The crossover frequency is selected by the freq-1 switch (S1), thereby defining the f_1 frequency band.

The filter output signal is then passed via the level adjustment control (RV601) on to the output buffer amplifier (Q106, 108–110, D104) where the impedance is again converted, and finally appears on the J102 output terminal. The role of this output buffer amplifier is to maintain the crossover-frequency and the input impedance of the power amplifier.

3. MID-LOW Channel Stage (CH-2)

The signal whose impedance was converted in the pre-buffer amplifier is narrowed down to a frequency band between f_1 and f_2 according to the freq-1 and freq-2 settings (see Fig. 3-2). Both the high-pass filter and low-pass filter feature sharp cut-off curves of 24 dB/oct (12 dB/oct cut-off characteristics in filters 2-1, 2-2, 2-3, and 2-4).

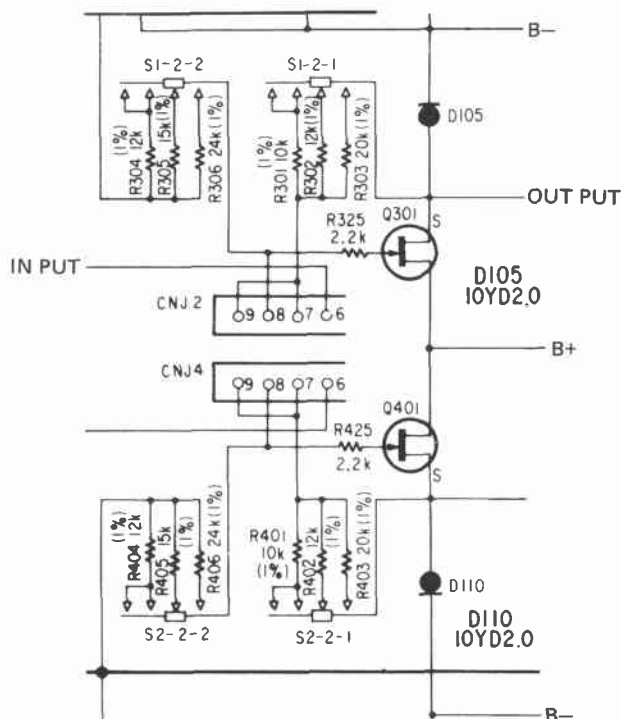

Fig. 2

The basic circuitry employed in the buffer amplifiers in each of the filters in the MID-LOW channel stage is outlined in Fig. 2. Each of these buffer amplifiers are source-follower amplifiers employing constant current diodes and FETs designed for high frequency circuits. The cascade-connected high frequency FET is used at the source follower, and a 100% negative feedback is applied for high input impedance and low output impedance. The load for this amplifier is D105. And since it is a constant current load, there is very little distortion, and no interference from the filter unit power supplies.

Since there is no need to operate the MID-LOW channel stage anywhere near the DC region, coupling capacitors have been employed prior to the RV602 control and the output terminals, thereby cutting DC drift and DC offset. The capacitor employed in front of RV602 consists of a tantalum capacitor (C305) connected in parallel with a film capacitor (C306), and has been inserted in order to prevent deterioration of sound quality.

The MID-LOW channel stage employs an output buffer amplifier (Q111) in the output stage for the same reason as the LOW channel stage.

4. MID-HIGH Channel Stage (CH-3)

The MID-HIGH channel stage employs the same basic circuit structure as the MID-LOW channel stage. The frequency band between the f_2 and f_3 crossover frequencies is set by the freq-2 and freq-3 switch positions (see Fig. 3-3).

5. HIGH Channel Stage (CH-4)

The circuitry of this stage is basically the same as the high-pass filter and output buffer amplifier employed in the MID-HIGH channel stage. The frequency band is determined by the f_3 crossover frequency set by the freq-3 switch position (see Fig. 3-4).

6. Muting Circuit (Fig. 4)

By activating a relay circuit, the muting circuit disconnects the signal line, and thereby prevents the appearance of any signals at the output terminals when the power switch is turned on and off. The "pop" noises generated at this time are therefore completely silenced. Note that this muting circuit is designed to release the output line from ground when the muting relays (RY1–RY8) are "on".

In addition, whenever the frequency response select cover is opened to exchange filter units, S8 is switched off, and again prevents the appearance of any signals at the output terminals.

1) When the power switch is turned on:

- (a) As soon as the power switch is turned on, B+ will commence to "charge up". C805 will also commence to charge up, requiring 2 to 3 seconds (as determined by the R804/C805 time constant) to be fully charged. During this period Q801 and Q802 will remain off, thereby keeping the muting relays (RV1–RV8) off as well. Therefore, no signals will appear at the

output terminals, effectively muting out the power switching noise.

- (b) 2 to 3 seconds after turning the power switch on, the potential on the base of Q801 reaches "on" potential, resulting in this transistor turning on.
- (c) As soon as Q801 is turned on, Q802 is also turned on, resulting in muting relays (RY1–RY8) being turned on, and the output signals appear at the output terminals.

2) When the power switch is turned off:

- (a) At the same time that the power switch is turned off, the positive potential which had been applied to the cathode of D807 via D806 decreases, resulting in the D807 diode being turned on by the forward biasing.
- (b) The charge on C805 is consequently discharged via D807 and R807, resulting in Q801 and Q802 both being turned off. The muting relays are also turned off, preventing any output signals from appearing at the output terminals. The "pop" noise generated when the power switch is turned off is also effectively muted.

Fig. 4

- 3) When the frequency response select cover is opened (Fig. 5):

When the frequency response select cover is opened, S8 is turned off, thereby cutting off the voltage being applied to the muting relays (RY1—RY8). These relays are therefore turned off, and no signals will appear at the output terminals. So none of the noise generated when exchanging units will reach the speakers.

Fig. 5

7. Bass Boost Circuit

LOW channel stage (CH-1) contains the bass boost circuit which compensates for low frequency of the speakers. In this circuit, response in dB at frequency of 50 Hz becomes 6 dB at maximum, in steps of 1.5 dB, owing to the T-type filter in NFB loop (negative feedback loop) of the output buffer amp.

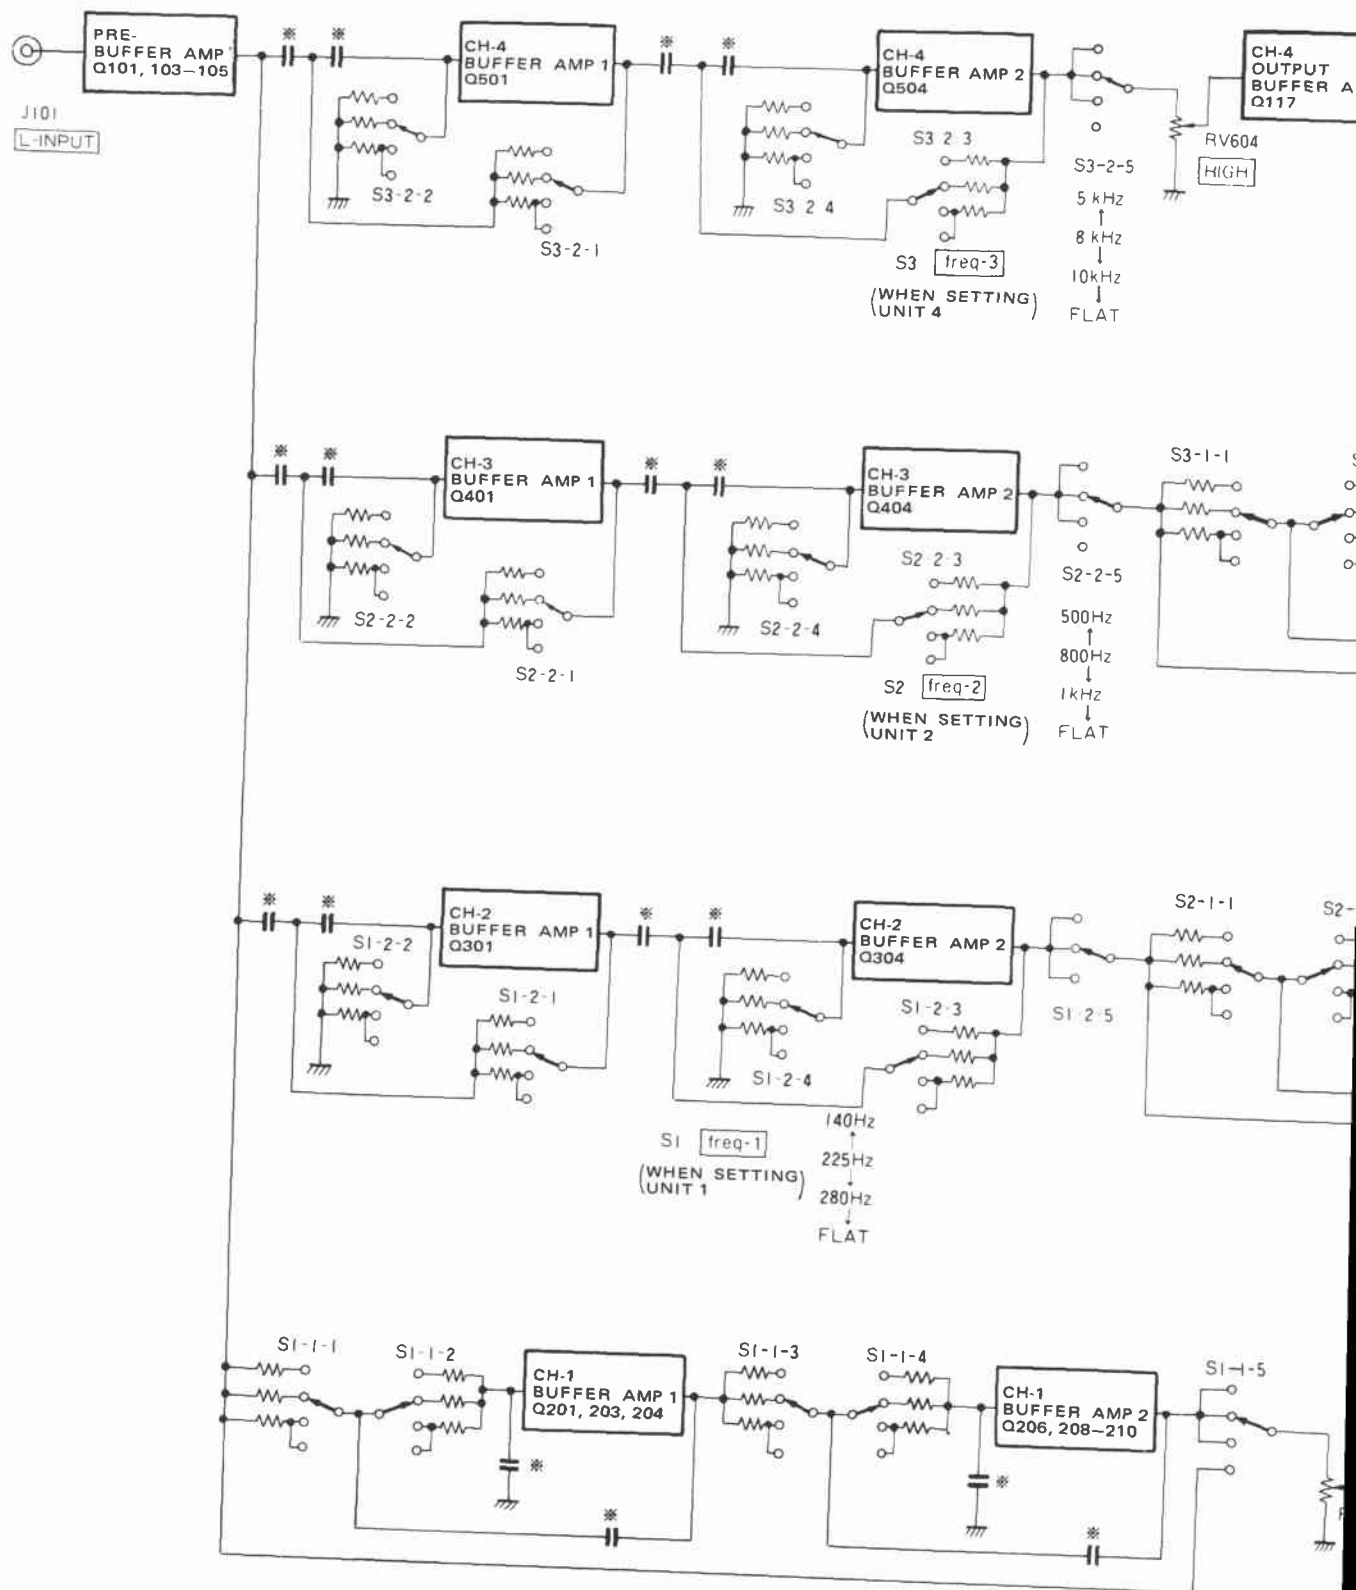

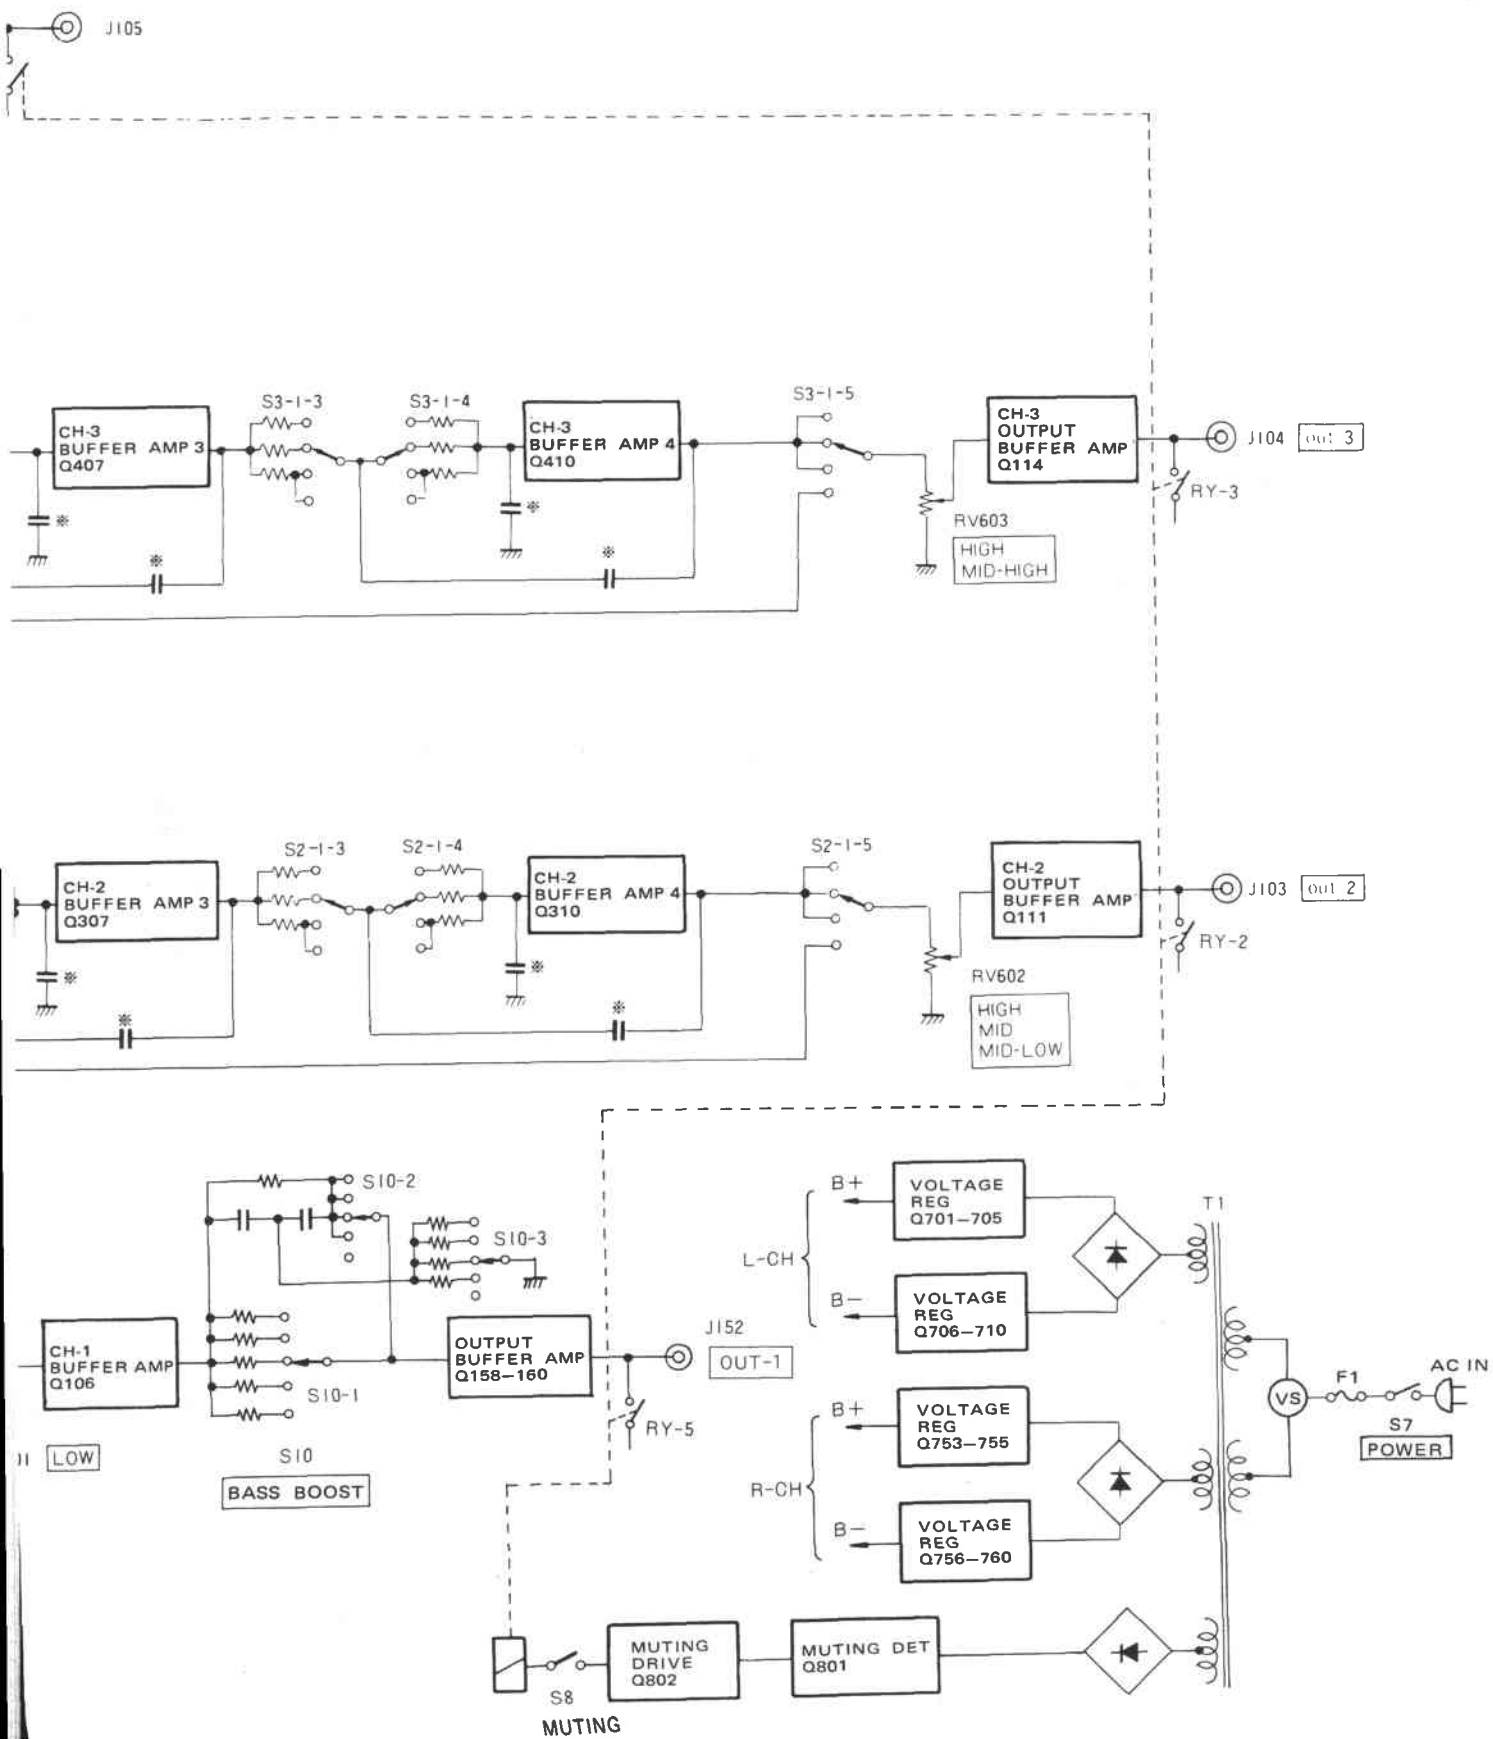

Fig. 6

NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "▲" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers (Δ-ΔΔΔ-ΔΔΔ-XX or Δ-ΔΔΔΔ-ΔΔΔ-X) may be different from those used in the set.

CAPACITORS:

- All capacitors are in μF . Common capacitors are omitted. Refer to the following lists for their part numbers.
MF: μF , PF: $\mu\mu\text{F}$.

RESISTORS

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.

- F : nonflammable

NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "●" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers (Δ-ΔΔΔ-ΔΔΔ-XX or Δ-ΔΔΔΔ-ΔΔΔ-X) may be different from those used in the set.

CAPACITORS:

- All capacitors are in μF. Common capacitors are omitted. Refer to the following lists for their part numbers. MF:μF, PF:μμF.

RESISTORS

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.

- F : nonflammable

The components identified by shading and mark Δ are critical for safety. Replace only with part number specified.

COILS

- MMH : mH, UH : μH

The capacitance values marked * are decided by setting the units 0 to 4.

Frequency marked ※1 means that it is measured when UNIT 1 is used.
Frequency marked ※2 means that it is measured when UNIT 2 is used.
Frequency marked ※3 means that it is measured when UNIT 3 is used.

Note:

- Components for right channel have same values as for left channel.
- All capacitors are in μF unless otherwise noted. $\text{pF} : \mu\mu\text{F}$
50WV or less are not indicated except for electrolytics and tantalums.
- All resistors are in ohms, $\frac{1}{4}\text{W}$ unless otherwise noted.
 $\text{k}\Omega : 1000\Omega$, $\text{M}\Omega : 1000\text{k}\Omega$
-  : nonflammable resistor.
-  : panel designation.
-  : B+ bus.
-  : B- bus.
- Readings are taken under no-signal conditions with a VOM (20 $\text{k}\Omega/\text{V}$).

Note: The components identified by shading and mark  are critical for safety. Replace only with part number specified.
